It is strange to find out about something amazing and new and then learn that although it is amazing it is not new at all. And that is the situation with PEMF also known as pulsed electromagnetic frequency technology. This technology is over 50 years old and has over 2000 referenced studies to back it up!

To start at the beginning, we are all electric. We carry electrical currents in our body. That's one of the reason we don't wet our fingers and then stick them into a wall socket. We *conduct* electricity. Some of this can be measured, with tests such as EEGs (for the brain, which we do in our office via brain mapping) or EKGs for heart testing and EMGs for nerve/muscle measurement. We are without doubt electrical.

We also know from the world of physics that around every electrical current there is a magnetic current that surrounds it. There is a strong interplay between electricity and magnetism and since physicists still debate how these two areas are related I am not going to try to explain it-we just know it exists.

So we have this electrical body, with every one of our trillions of cells carrying an electrical charge inside and having a membrane wall around it that is based also on electrical charges. And with it all is a magnetic current.

Now, cells are all programmed to do their particular job. Liver cells act like liver cells and heart cells act like heart cells and muscle cells, lymph, thyroid, etc. all do their jobs. To perform their jobs takes energy. The cell has an internal power plant that makes energy to give the cells the ability to do its work. No energy, no work.

The energy of the cell comes predominantly from ATP which is a self-manufactured chemical that creates electrons inside the cell which then powers the cell. These electrons are crucial to get the work done.

There is another reason these electrons are important.

Let's say you broke your wrist three years ago. You fell. Now it is three years later and that wrist has healed pretty well, but is just not as good and strong as the other. You look at it and think, "well, I did break it pretty badly". You assume it just never totally healed.

The only problem is that although you broke your wrist three years ago, that is not the wrist you currently have. Those cells are mostly long gone and have been replaced with new cells. This is a new wrist. Unfortunately your body did not have enough energy in the cells of your wrist, so when they replaced the damaged cells, they replaced them with new *damaged* cells instead of new *healthy* ones.

So now we see two areas where this idea of cellular energy is critical. First for the cell to do its job and secondly to replace old and/or damaged cells with new healthy ones.

This energy we are speaking about is from that same source of electrons made with ATP inside the cell. You can see how critical this is for health.

In order to power the cells and help us heal it would be great to send electricity into the cell to give electrons and watch wonderful things happen. But that is not possible. The amount of electricity that it would take would damage the skin and everything in its way as it goes toward the inside of your body into different cells. Not a good idea!

However, the alternative is to send magnetic energy into the cell. This does not cause any problems on the way in and when it gets to the cell it gets converted to electrical energy so the cell can use it as it needs. It can use it to increase functioning or to help it replace damaged cells with healthy ones.

This is the wonder of PEMF.

One of the first places this was used was with astronauts. When they originally went into space, they came back with tremendous bone loss due to their time without gravity. Without gravitational pressure on their bodies they became riddled with osteoporosis or brittle bone. Research and studies showed that by supplying pulsed electromagnetic frequencies they could restore lost bone and by sending units in space with them problems were prevented from occurring in the first place.

A quick look on line will show study after study with PEMF. It is proven to help with bone and wound healing, tears, sprain, strains, depression, cancer, heart disease and so on. If there is a problem, it is a cellular problem and PEMF may be able to help.

Anytime you can supply the body with energy, good things can happen.

The basis of this technology is the use of electromagnetics and the outcome is often near miraculous.

Ok, here we go. So if this is so good, why haven't I heard of it? Well, if you know me, you know this is my least favorite question. Let's just be happy that we have it now and let's spread the word to those who need it.

Will it help you?

Ask us for a free examination to see if you are a candidate.

# PEMF

The Electromagnetic Technology!

Helping with symptoms of:

Joint Pain

Bladder Problems

ED

Prostate Symptoms

Digestive Disturbance

Sinus Discomfort

And more...
